

# XPS, Optical properties

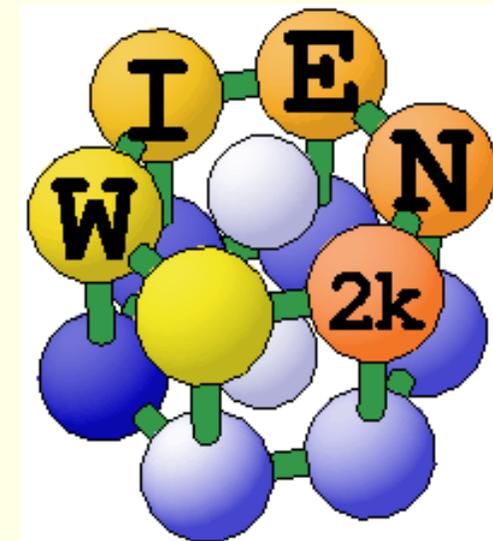

---

**Peter Blaha**

Institute of Materials Chemistry, TU Wien

**(Xavier Rocquefelte)**

University of Rennes

# Photoemission spectroscopy, PES

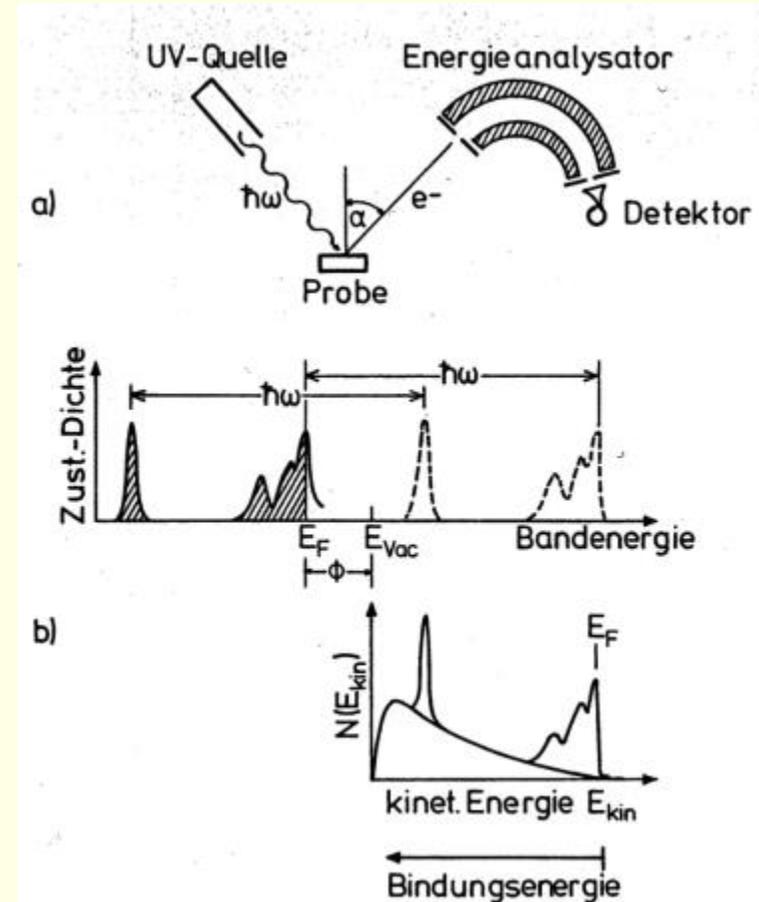

- Illuminate sample with light of known energy, measure kinetic E of emitted electrons  $e^-$

→ core- $e^-$ , Valence-DOS

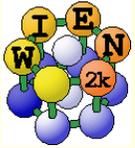

## ■ Energyconservation:

$$\hbar\omega = \phi + E_{kin} + E_b$$

- $\phi$ : work function
- $E_{kin}$ : kinetic E of  $e^-$
- $E_b$ : bindingenergy of  $e^-$

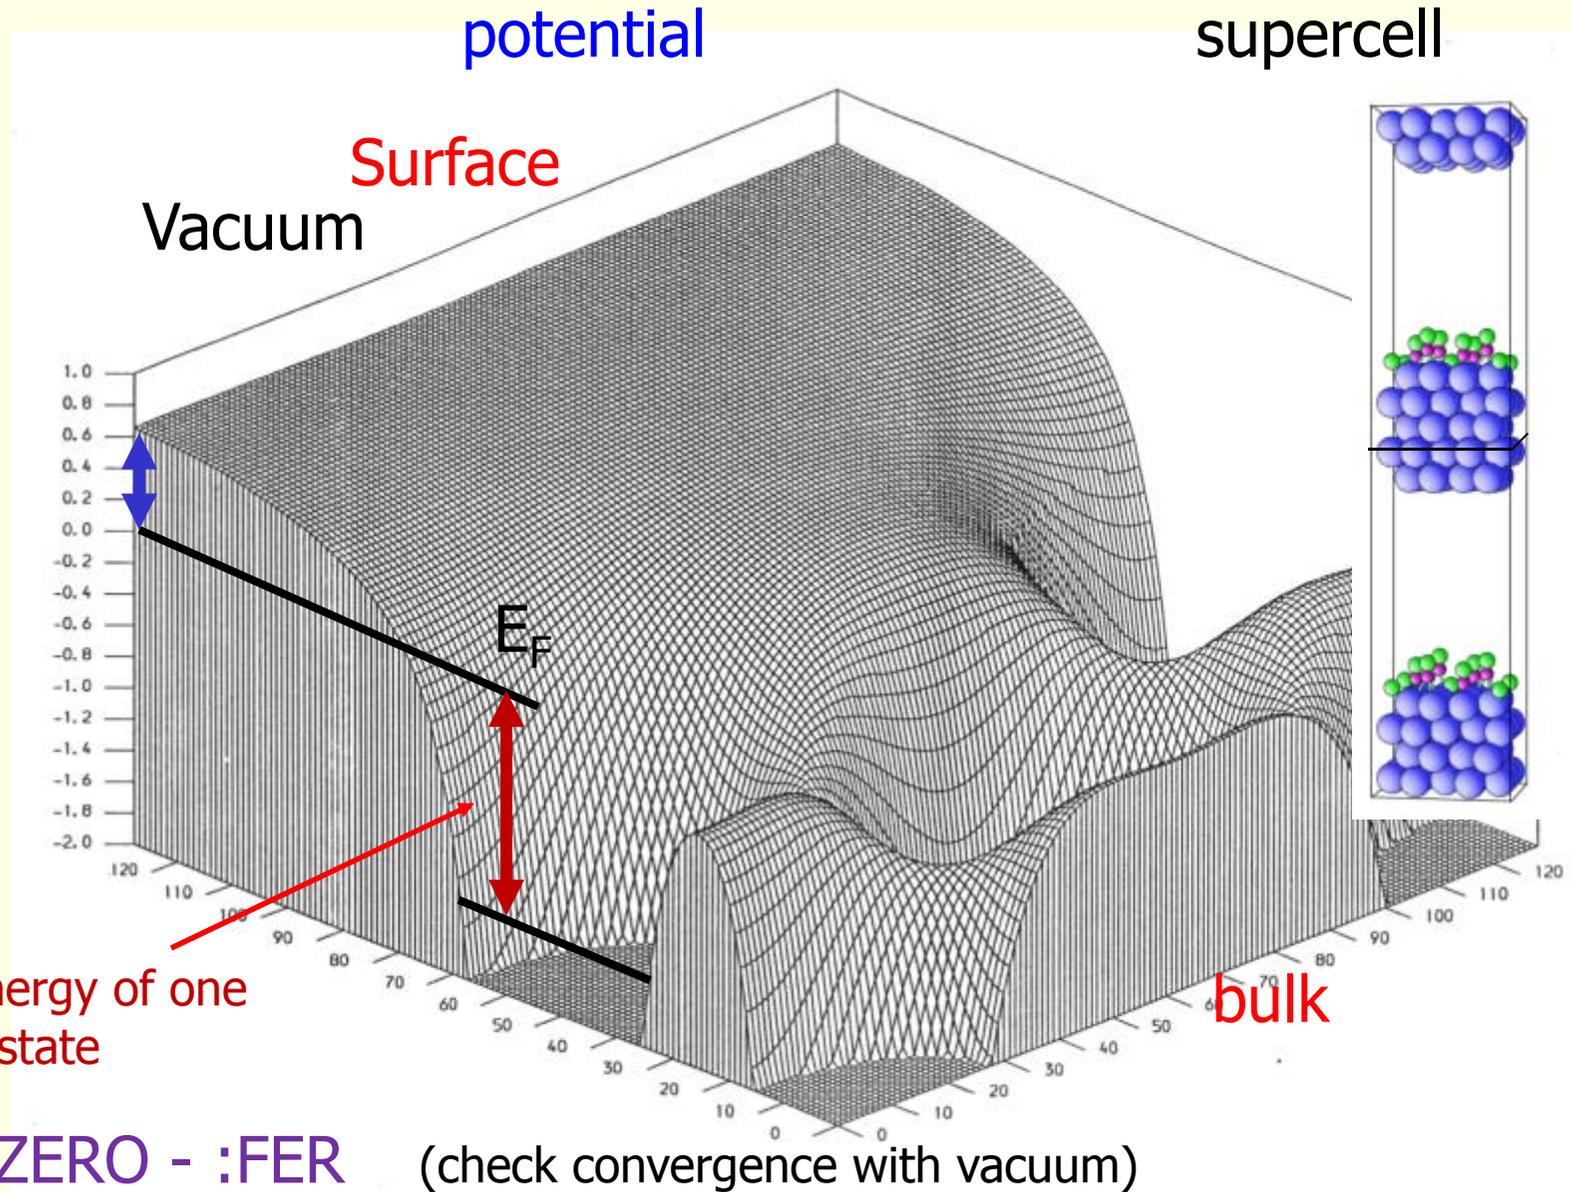

- UPS: UV (He-light, 21.1 und 40.4 eV), for valence-electrons
- XPS, ESCA: X-rays (Al 1486 eV), for core and valence-electrons
- Synchrotronradiation: UV or X-rays of "any" wavelength

# Work function

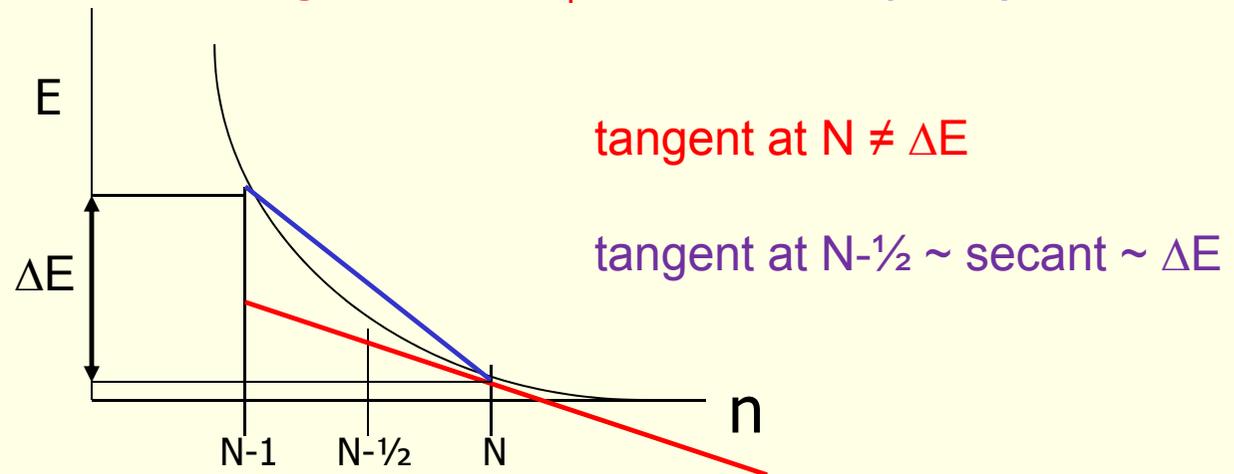

Work-  
function

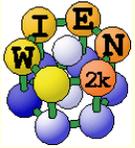

# XPS, core-level shifts

- Ionization potential of core- $e^-$ ,  $IP = E^{\text{tot}}(N) - E^{\text{tot}}(N-1)$ 
  - *gives information on charge state of the atom*
- core-eigenvalues  $\varepsilon_i$  are NOT a good approximation:  $\varepsilon_i = dE/dn$
- **Slater's "transition state"**: core-eigenvalues  $\varepsilon_i$  for half occupancy

- $\Delta$ -SCF-calculation with and without core-hole:  $E^{\text{tot}}(N) - E^{\text{tot}}(N-1)$ 
  - *supercells to reduce hole-hole interaction*

C,N 1s	exp.(eV)	$\varepsilon_i$	$\Delta$ -SCF
TiC	281.5	264.7	281.9
Ti <sub>4</sub> C <sub>4</sub>	281.5	263.3	281.1
TiN	397.0	377.5	397.1

# valence $e^-$ : bandstructure via ARPES

## Normalemission:

Surface state  
d-band  
sp-band

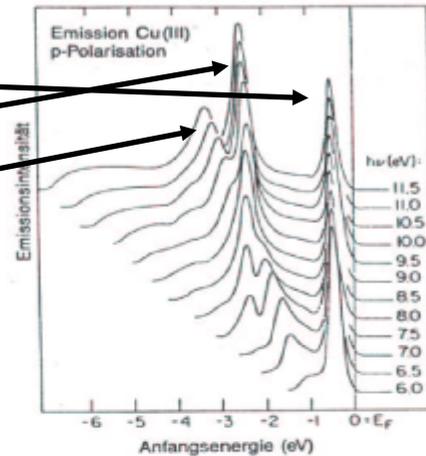

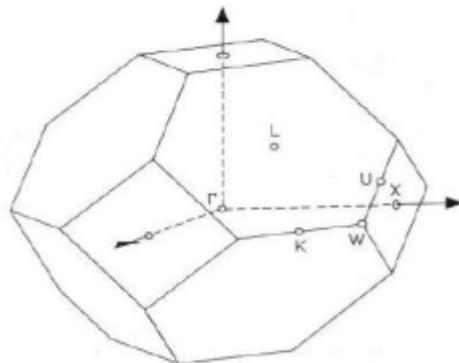

Abb. 3.11a. UP-Spektren einer Cu(111)-Oberfläche bei Detektion normal zur Oberfläche und Variation der Photonenenergie von 6 bis 11,5 eV. Als Energieachse dient die Bindungsenergie bezogen auf die Fermi-Energie, hier als Anfangsenergie der Elektronen bezeichnet [29].

## Brillouinzone fcc:

## Volumenbandstruktur:

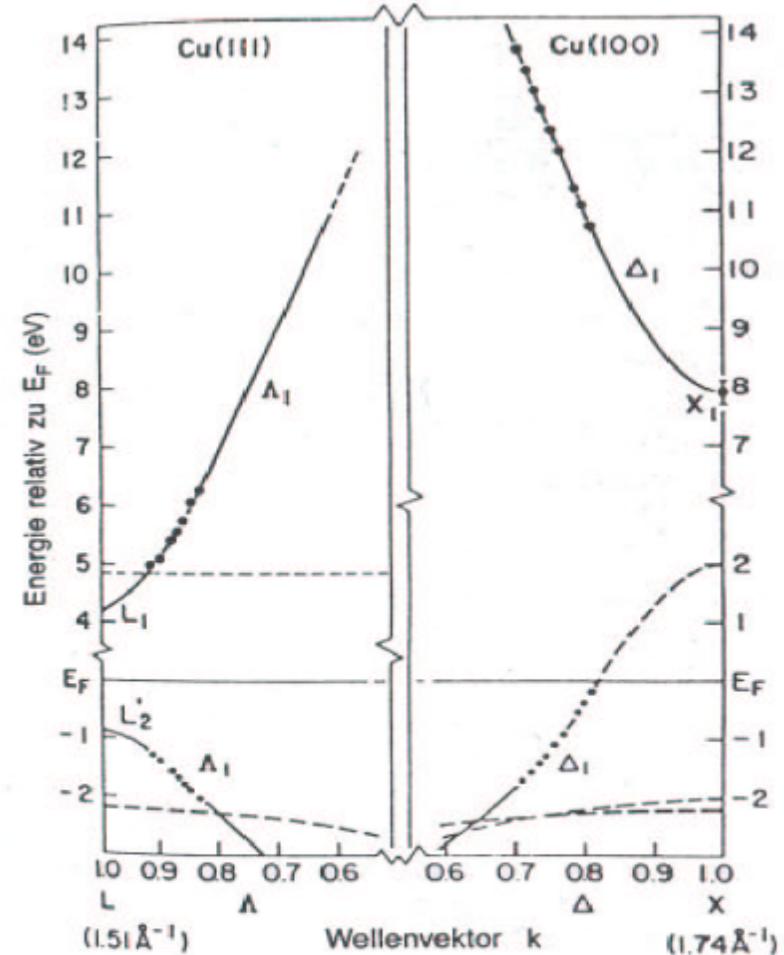

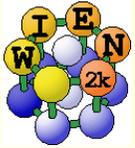

Abb. 3.11b. Aus den Spektren von Abb. 3.11a ermitteltes Bänderschema in den [111]-( $\Gamma$ -L)- und [110]-( $\Gamma$ -X)-Richtungen. Die Punkte geben die gemessenen Peakpositionen aus 3.11a wieder, die Linien sind aus einer theoretischen Bandstruktur. Beim Vergleich mit der Cu-Bandstruktur in der Abb. 3.10 beachte man den unterbrochenen Energiemaßstab und den unterdrückten  $\Gamma$ -Punkt in Abb. 3.11b [29].

# valence PES: usually explained by DOS

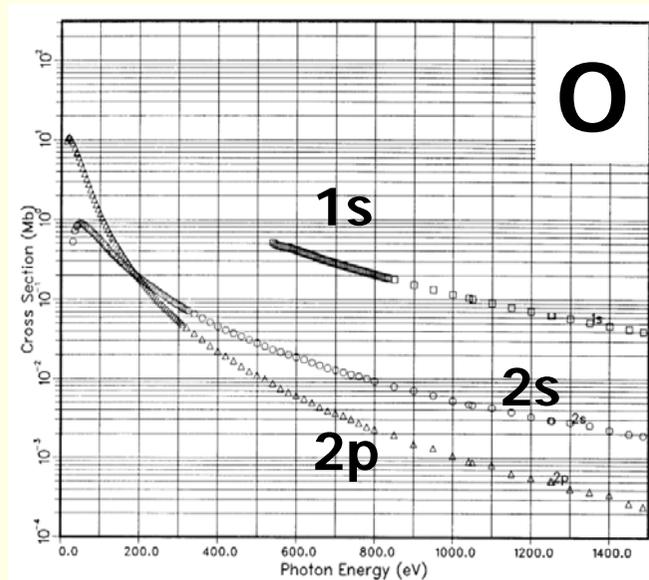

- a single DOS cannot explain the E-dependency of PES

- $I = \sum_{atoms,l} N_{a,l} \sigma_{a,l}$

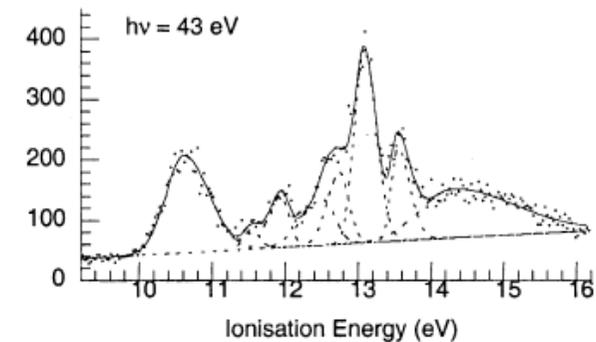

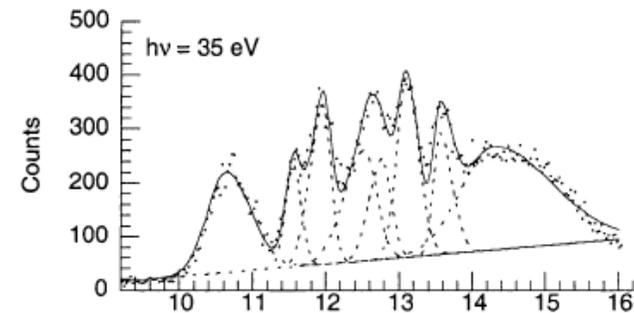

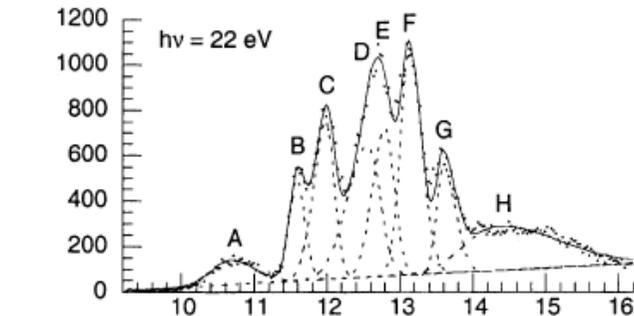

- $N_{a,l}$  = Partial DOS

- $\sigma_{a,l}$  = atomic cross section

Photoionization cross-sections: a guide to electronic structure

Jennifer C. Green<sup>a,\*</sup>, Piero Decleva<sup>b</sup>

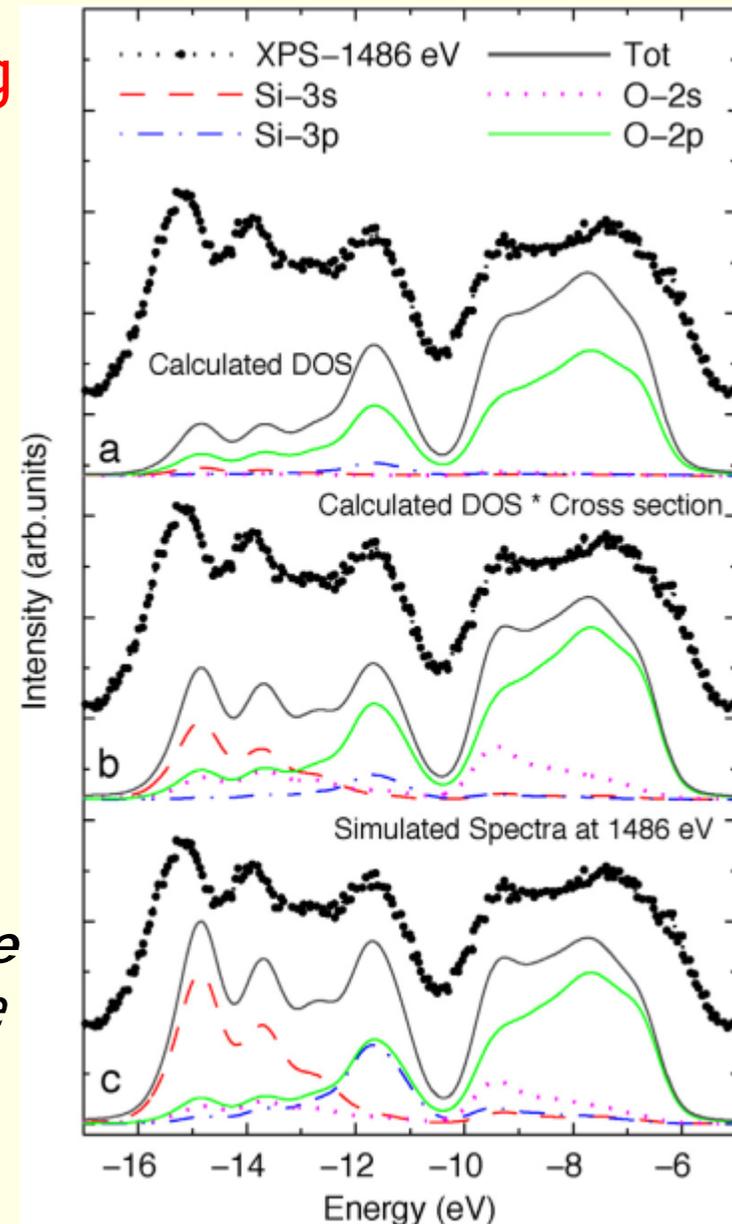

PE spectra of TiMeCl3 at 22, 35 and 43 eV.

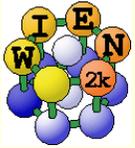

# SiO<sub>2</sub> valence band XPS

- **Total DOS** gives 5 peaks, but wrong intensities
- **Cross section modulated PDOS** gives better intensities
- **Renormalized PDOS \*  $\sigma$**  gives perfect intensities
  - *renormalization according to the inverse charge fraction of an orbital within the atomic sphere + removal of interstitial DOS:*  
$$N_{tot} = \sum_{atoms,l} N_{a,l} + N_{int}$$

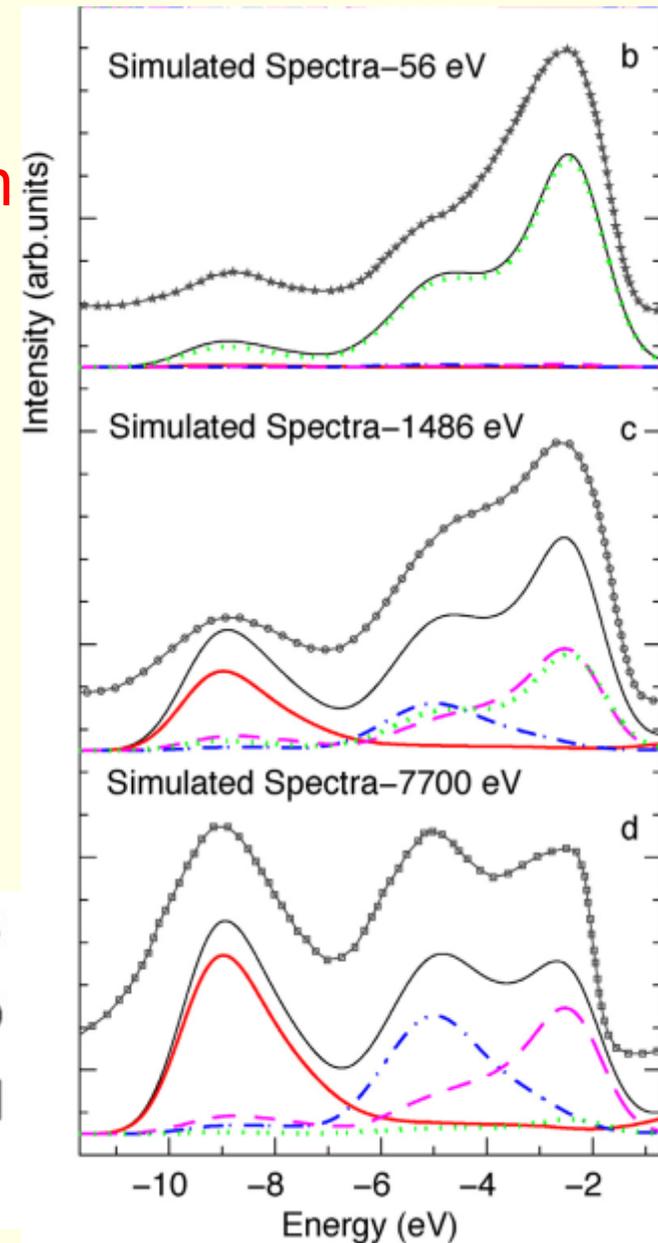

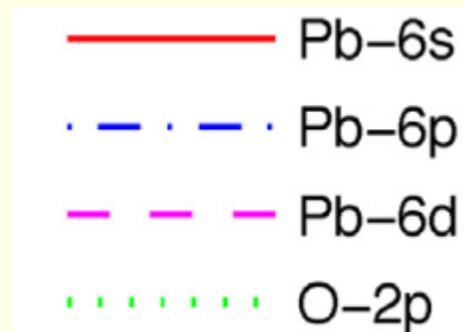

# PbO<sub>2</sub> at 3 different energies

- 56eV: O-2p PDOS explains the spectrum
- 1486 eV: all orbitals contribute
- 7700 eV: O-2p not important

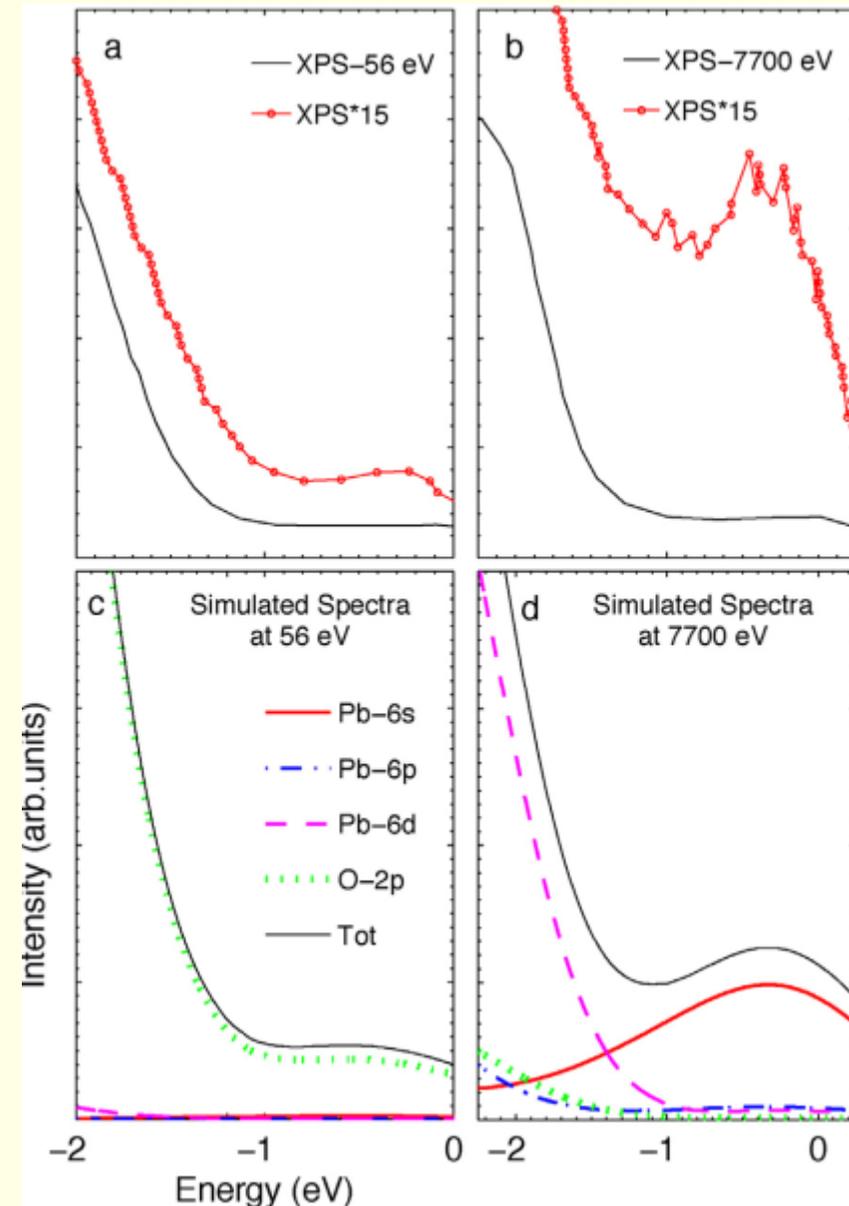

# PBO<sub>2</sub> at very low BE

- 56 eV: almost no intensity till -1 eV
- 7700 eV: strong contribution from antibonding Pb-6s

## 5 – OPTICAL PROPERTIES SIMULATION IN WIEN2k

In WIEN2k, two types of contributions to the dielectric function ( $\epsilon = \epsilon_1 + i.\epsilon_2$ ) could be estimated:

**Interband** contributions  
(based on IPA\*)

**Intraband** contributions  
(using a Drude-like term)

→ Dielectric tensor / Optical conductivity / Refractive index /  
Reflectivity / Absorption coefficient / Loss function (EELS)

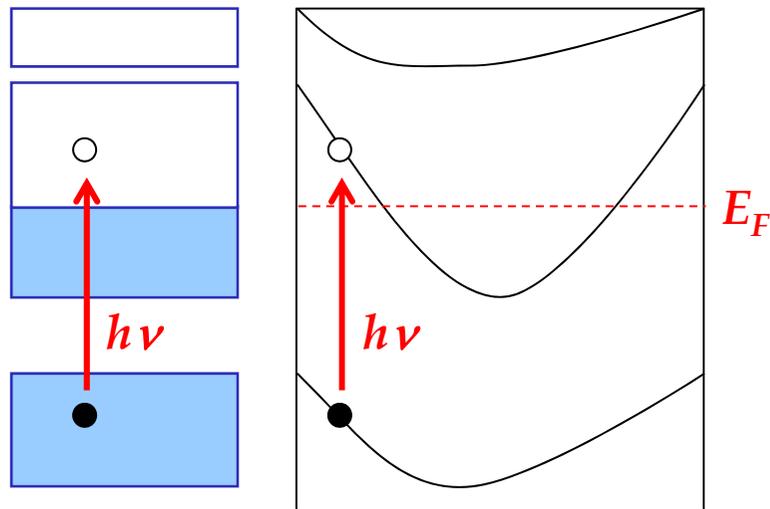

\*IPA: Independant Particle Approximation

# 5 – OPTICAL PROPERTIES SIMULATION IN WIEN2k

In WIEN2k, two types of contributions to the dielectric function ( $\epsilon = \epsilon_1 + i.\epsilon_2$ ) could be estimated:

*Interband* contributions  
(based on IPA\*)

Sum over all valence and conduction bands

joint density of states

$$\sum_{vck} \delta(\epsilon_{kc} - \epsilon_{vk} - \omega)$$

transition probability

$$\text{Im}(\epsilon_{ij}(\omega)) = \frac{16\pi^2}{\Omega \omega^2} \sum_{vck} \langle vk | p_i | ck \rangle \langle ck | p_j | vk \rangle \delta(\epsilon_{kc} - \epsilon_{vk} - \omega)$$

\*IPA: Independant Particle Approximation

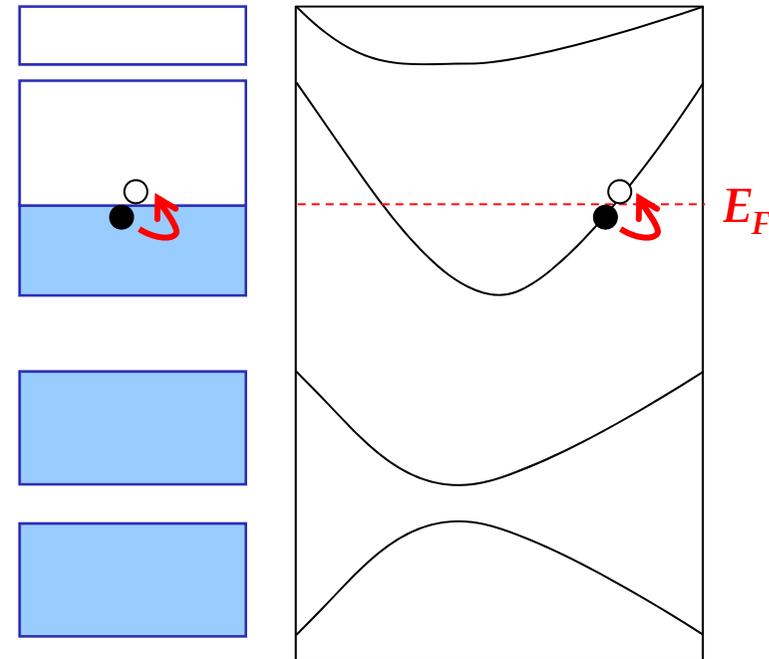

## 5 – INTERPRETATION: Intraband transitions (for metals)

**intraband:** Drude model,  
( $\omega_p$ : plasma frequency)

$$\text{Im } \epsilon^{\text{intra}} = \frac{\Gamma \omega_p^2}{\omega (\omega^2 + \Gamma^2)}$$

**Plasma frequency:** (longitudinal  
oscillations of the electron gas)

*Intraband contributions*  
(using a Drude-like term)

$$\omega_{p,\alpha\beta}^2 = \frac{4\pi e^2}{\Omega^2} \left( \frac{n}{m} \right)_{\alpha\beta} = \frac{e^2}{m^2 \pi^2} \sum_l \int d\mathbf{k} \langle l | p^\alpha | l \rangle_{\mathbf{k}} \langle l | p^\beta | l \rangle_{\mathbf{k}} \delta(\epsilon_l - \epsilon_F)$$

## 5 – OPTICAL PROPERTIES SIMULATION IN WIEN2k

### Optical functions:

- Dielectric tensor
 
$$\Im \epsilon_{ij} = \frac{16\pi^2}{\Omega \omega^2} \sum_{vck} \langle vk | p_i | ck \rangle \langle ck | p_j | vk \rangle \delta(\epsilon_{kc} - \epsilon_{vk} - \omega)$$

$$\Re \epsilon_{ij} = \delta_{ij} \frac{2}{\pi} P \int_0^{\infty} \frac{\omega' \Im \epsilon_{ij}(\omega')}{\omega'^2 - \omega^2} d\omega'$$
- Optical conductivity
 
$$\Re \sigma_{ij}(\omega) = \frac{\omega}{4\pi} \Im \epsilon_{ij}(\omega)$$
- Refractive index
 
$$n_{ii} = \sqrt{\frac{|\epsilon_{ii}(\omega)| + \Re \epsilon_{ii}(\omega)}{2}} \quad k_{ii}(\omega) = \sqrt{\frac{|\epsilon_{ii}(\omega)| - \Re \epsilon_{ii}(\omega)}{2}}$$
- Reflectivity
 
$$R_{ii}(\omega) = \frac{(m_{ii} - 1)^2 + k_{ii}^2}{(m_{ii} + 1)^2 + k_{ii}^2}$$
- Absorption
 
$$A_{ii}(\omega) = \frac{2\omega k_{ii}(\omega)}{c}$$
- Loss function
 
$$L_{ii}(\omega) = -\Im \left( \frac{1}{\epsilon_{ii}(\omega)} \right)$$

## 5 – OPTICAL PROPERTIES SIMULATION IN WIEN2k

### *Symmetry of the dielectric tensor*

$$\textit{triclinic} \quad \begin{pmatrix} \text{Im } \epsilon_{xx} & \text{Im } \epsilon_{xy} & \text{Im } \epsilon_{xz} \\ \text{Im } \epsilon_{xy} & \text{Im } \epsilon_{yy} & \text{Im } \epsilon_{yz} \\ \text{Im } \epsilon_{xz} & \text{Im } \epsilon_{yz} & \text{Im } \epsilon_{zz} \end{pmatrix}$$

*monoclinic* ( $\alpha, \beta = 90^\circ$ )

$$\begin{pmatrix} \text{Im } \epsilon_{xx} & \text{Im } \epsilon_{xy} & 0 \\ \text{Im } \epsilon_{xy} & \text{Im } \epsilon_{yy} & 0 \\ 0 & 0 & \text{Im } \epsilon_{zz} \end{pmatrix}$$

*orthorhombic*

$$\begin{pmatrix} \text{Im } \epsilon_{xx} & 0 & 0 \\ 0 & \text{Im } \epsilon_{yy} & 0 \\ 0 & 0 & \text{Im } \epsilon_{zz} \end{pmatrix}$$

*tetragonal, hexagonal*

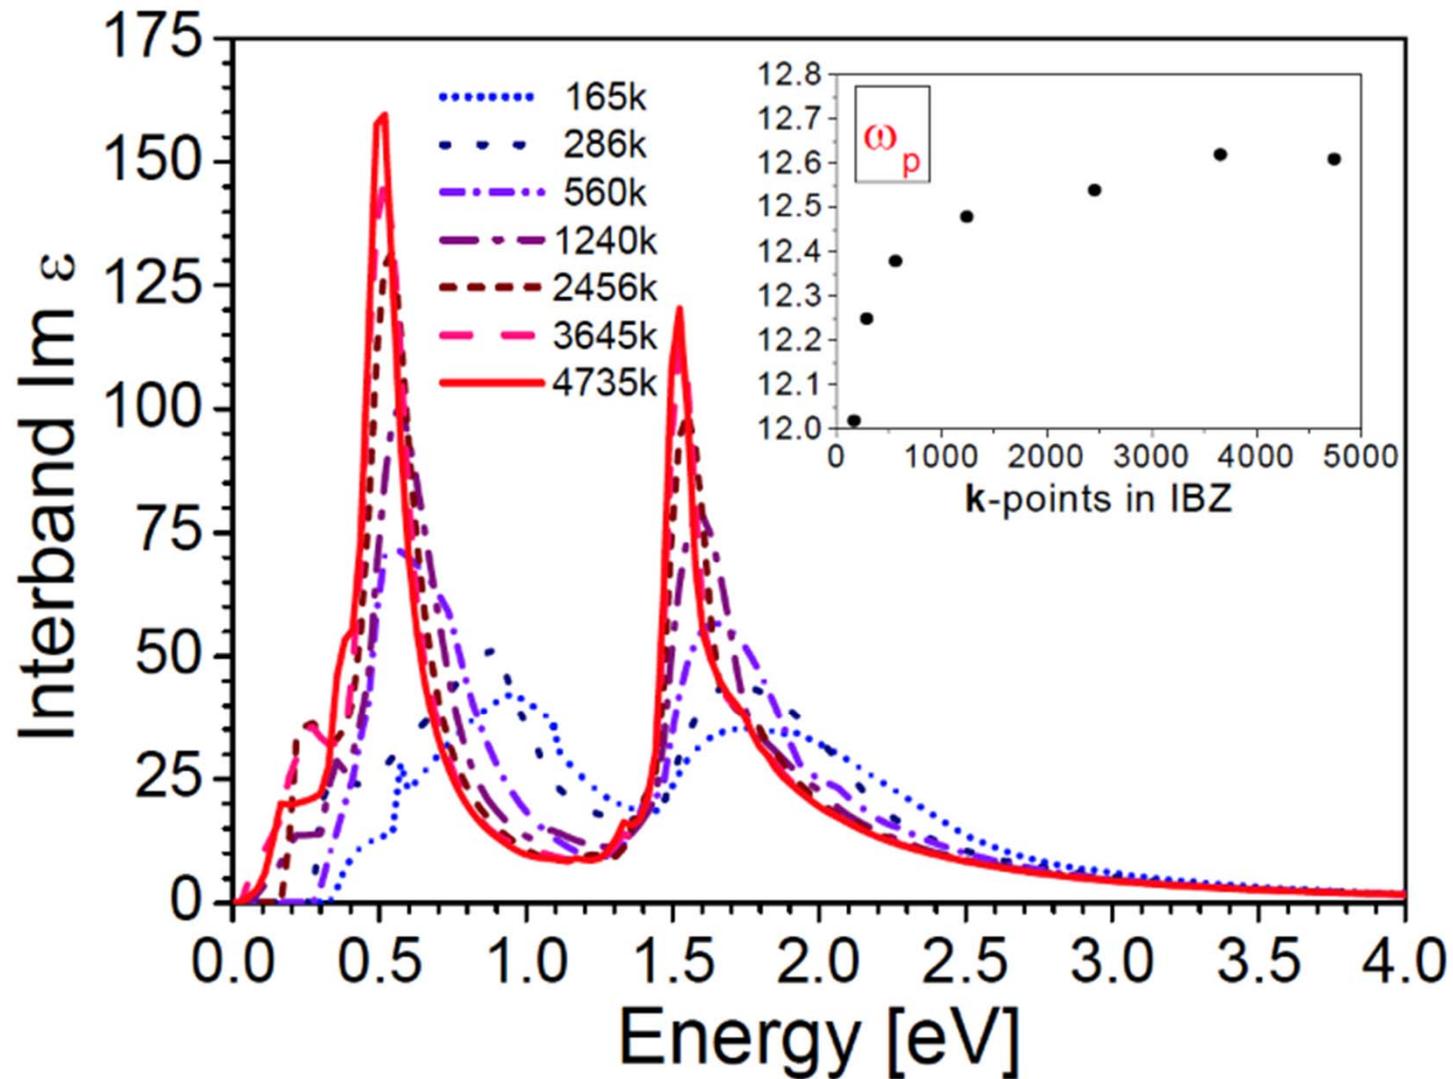

$$\begin{pmatrix} \text{Im } \epsilon_{xx} & 0 & 0 \\ 0 & \text{Im } \epsilon_{xx} & 0 \\ 0 & 0 & \text{Im } \epsilon_{zz} \end{pmatrix}$$

*cubic*

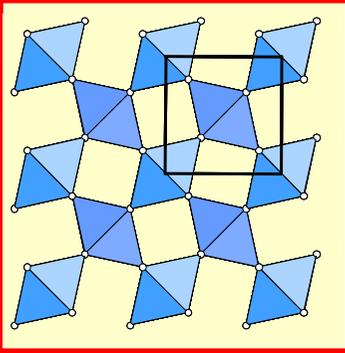

$$\begin{pmatrix} \text{Im } \epsilon_{xx} & 0 & 0 \\ 0 & \text{Im } \epsilon_{xx} & 0 \\ 0 & 0 & \text{Im } \epsilon_{xx} \end{pmatrix}$$

## 7 – Limitations:

*The band gap problem → Necessity to go beyond DFT*

$$E_g = \varepsilon_{N+1}(N+1) - \varepsilon_N(N) = I - A$$

$$E_g = \varepsilon_{N+1}(N) - \varepsilon_N(N)$$

$$E_g = \underbrace{\varepsilon_{N+1}(2N) - \varepsilon_N(2N)}_{\varepsilon_g} + \underbrace{\varepsilon_{N+1}(2N+1) - \varepsilon_{N+1}(2N)}_{\Delta_{xc}}$$

$$E_g = \varepsilon_g + \Delta_{xc} \quad \text{with } \Delta_{xc} \text{ Scissor Operator/mBJ/hybrid/GW...}$$

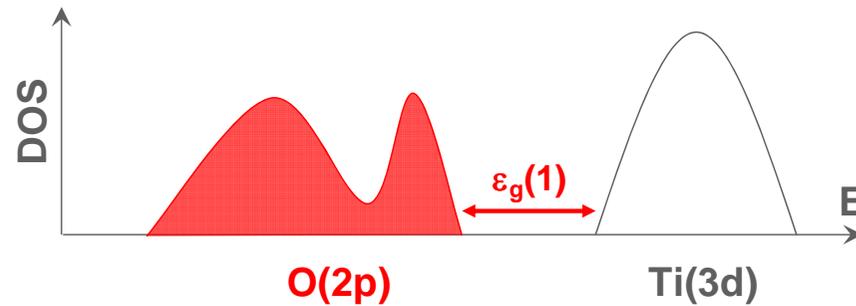

*Ionization energy:  $\varepsilon_N(N) = -I$*

*Electro-affinity:  $\varepsilon_{N+1}(N+1) = -A$*

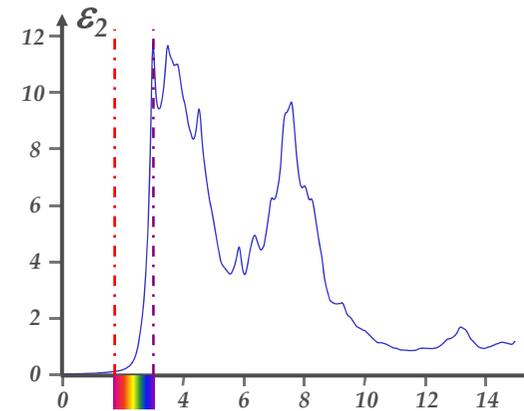

## 5 – OPTICAL PROPERTIES SIMULATION IN WIEN2k

*Fundamental gap: electronic gap  $\neq$  optical gap*

**Deduced from the band structure**

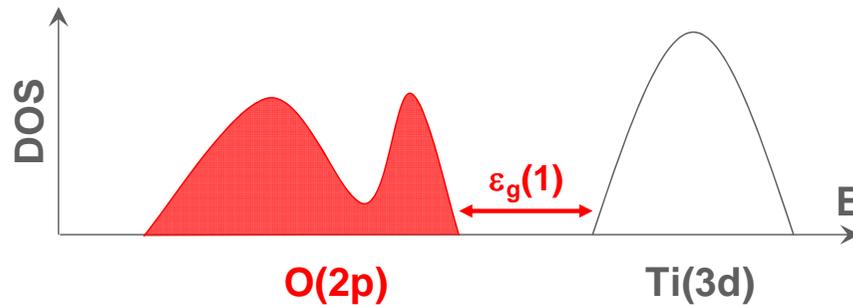

**Dipolar transitions**

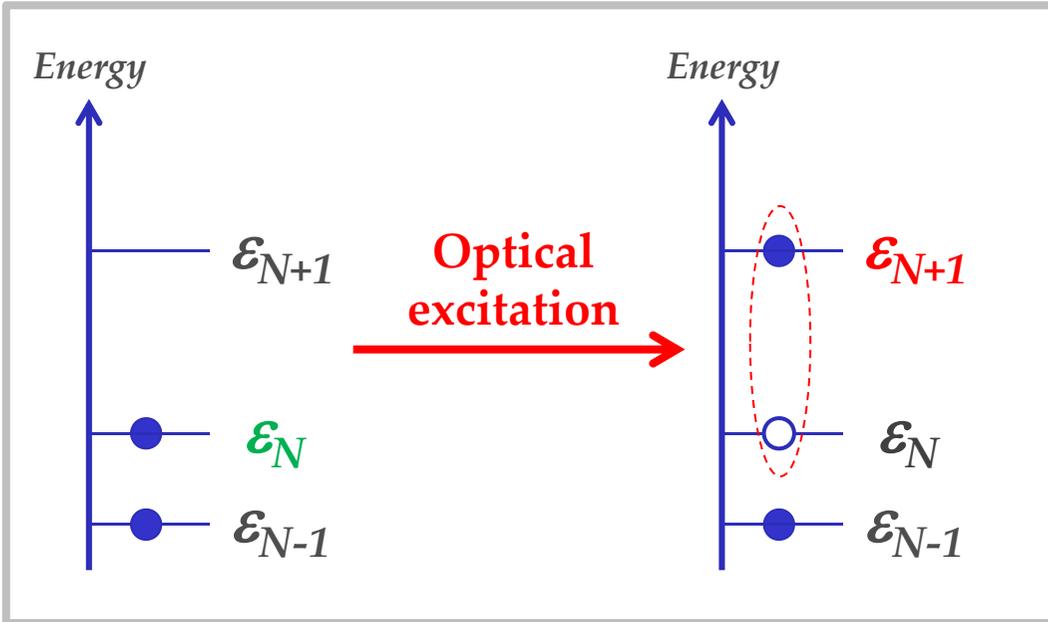

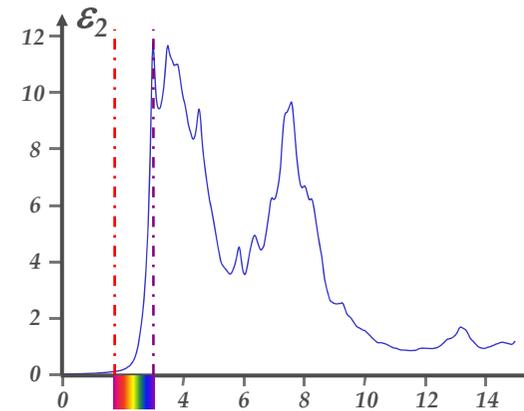

# 5 – OPTICAL PROPERTIES SIMULATION IN WIEN2k

*Fundamental gap: electronic gap  $\neq$  optical gap*

**Deduced from the band structure**

**Dipolar transitions**

*If excitonic effects:  
we should go beyond  
(TDDFT / BSE)*

## *7 – Some limitations of DFT simulation of optical properties*

- **Kohn-Sham eigenstates interpreted as excited states**
- **Independent-particle approximation (no  $e^- - h^+$  interaction)**
  - Use of Bethe-Salpeter Equation (BSE) – Time-dependent DFT
- **LDA/GGA are not exact**
  - Use of hybrid DFT, effective potentials
  - Use of DFT+U, LDA+DMFT, GW...
